STK

(SAFETY TRAINING KIOSK)

The **Safety Training Kiosk** was designed to modernize the safety training practice and has since altered the safety training procedure. An interactive kiosk with a touch screen that automates the process of providing safety instruction to workers, guests, drivers, and contract laborers is known as a STK.

STK has exclusive benefits for businesses and staff members. The ability to create training modules, manage the program, and access all analytics and data is provided to the businesses.

Through self-registration and the STK-guided procedure, users may obtain training and create safety permits to gain entry into the organization. They will receive step-by-step instructions on how to register, select a language, see instruction, and take exams. Users must show up for a brief quiz after finishing the safety training video series. Once the exam is completed successfully, STK creates a user-specific safety permit.

An Extensive Approach For Safety Training

Today, every organization is concerned about safety. A secure and safe working environment can only be achieved by being prepared and receiving ongoing training, even if it is impossible to prevent every unfortunate incidence. Although there are several ways to provide training, a classroom-based approach to safety instruction can become tedious and ineffective as a result of cutting corners.

The Safety Training Kiosk, or STK, assists you in adopting a 360-degree approach to safety training, guaranteeing that all parties involved receive training according to their level of risk exposure and based on the plan's overall impact on risk reduction.

The following infographic lists the key elements of a STK (Safety Training Kiosk):

THE FOLLOWING IS OUR STK PROCESS FLOW.

- STK Client : To utilize the trainee registration, see the safety video, take the exam, and provide proof of safety.
- STK Admin : This administrator's functions include creating training modules, uploading training material, creating question banks, setting languages, and generating reports.
- STK Mobile App allows administrators using Android mobile devices to remotely check kiosk information and produce reports.
